                                                                                                                                                                                                                                        PCR primers AAX26565-66 were used to amplify introns and exons of cDNA encoding human marenostrin. The mutated form of the protein is responsible for familial Mediterranean fever (FMP). Detection of mutations in the marenostrin gene is useful for the diagnosis or treatment of FMF, especially associated with mutations in the last exon
                                                                                                                                                                    useful for detecting mutations responsible for

The invention provides a human soluble protein ZTMPO-1 which has homology to the thymopoletin-emerin family of nuclear membrane proteins. The ZTMPO to the thymopoletin-emerin family of nuclear membrane proteins. The ZTMPO levels of ZTMPO-1 receptor polypeptides may be indicative of pathological levels of ZTMPO-1 receptor polypeptides may be indicative of pathological conditions including cancer, cardiac and autoimmune disorders and infectious diseases. The nucleic acid can be used as source of hybridization probes for detecting a genetic abnormality in a patient. The ZTMPO-1 polypeptides can be used to modulate cellular proliferation and differentiation in a diverse array of tissues such as testis, skeletal muscle, thyroid and adrenal gland. Antagonists of ZTMPO-1 can be used in modulating cellular proliferation and differentiation such as in tumor growth and development. They can also be used for inhibiting to spermatogensis and sperm activation. Such ZTMPO-1 antagonists can be used for contraception in humans and animals, and in particular, domestic and efettilization of an egg. ZTMPO-1 antagonists could also be used to mediate immune response, e.g. by boosting the humoral response in individuals at risk for an infectious disease or as a supplement to grown and all manner and animal and primer specific for the grown and animal and primer specific for the grown and animal and animal and animal animals.

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets uncleid acids involved in bronchoconstriction, alleagues, and/or inflammation. The ON can have antiinflammatiory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are impaired airways, including lung disease associated with inflammation, cimpaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating ce.g. ischaemic conditions, pulmonary vasconstriction, alleagues, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive fibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the carcinomas, and effects. The A-containing ONS break down with the correspond to SEQ ID NO:1 to 185, but the sequences differ invention, which correspond to SEQ ID NO:1 to 185, but the sequences differ cinvention, which correspond to SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:1 to 1885, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequence differ from the previously named sequences. SEQ ID NO:1 to 180 (AAA32332 to AAA33992) are specifically claimed ONS from the present invention do not match lighting the their corresponding SEQ ID NO: sequences given in the sequence given in the sequence given in the disclosure of the present invention do not match lighting the sequences given in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antiallergic; antiasthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD; cancer; leukaemia; lymphoma; carcinoma; metastasis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; adenosine receptor; low adenosine antisense oligonucleotide; phosphorothioate; impaired respiration; inflammation; allergy; allergic disease; bronchoconstriction; inhibitor; antiinflammatory;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets conclete acids involved in bronchoconstriction, allergies, and/or conclete acids involved in bronchoconstriction, allergies, and/or conclete acids involved in analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects affilict the lungs of a subject. They can be used for treating confitients, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which any meteastasise to the lungs, including breast and prostate cancer. The A-containing ONS break down with the carcinomas, and and cancers which activates adenosine content of the ONS reduces side effects. The A-containing ONS break down with the correspond to SEQ ID NO:1 to 2815, and then the last 185 containing which correspond to SEQ ID NO:1 to 2815, and then the last 185 containing which correspond to SEQ ID NO:1 to 2815, and then the last invention, which correspond to SEQ ID NO:1 to 186; but the sequences differ from the previously named sequences. SEQ ID NO:1 to 1869 (AAA32932 to AAA33992) are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention. N.B. Sequences given in the disclosure of the present invention of the sequences. SEQ ID NO:11 to 1869 do not match match contains the present invention in the sequences. SEQ ID NO:11 to 1869 do not match contains the present invention of the present invention in the sequence.
                          New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or
                                                                                                                                                                                            Claim 18; Page 471; 1343pp; English.

Antisense molecules directed against nucleic acid encoding human CD40, for treating e.g. immune, inflammatory or hyperproliferative diseases.

Claim 3; Page 45; 102pp; English.

expression of human CD40. CD40 is involved in lymphocyte activation, the expression of human CD40. CD40 is involved in lymphocyte activation, prowned and/or angiogenesis. Inhibition of CD40 is used to treat or prevent immune-associated diseases (specifically quest vs. host disease, allograft rejection or autoimmune diseases); inflammation (specifically disease or psoriasis) or hyperproliferation (specifically another or program or hyperproliferation (specifically cancer and tumnours). the antisense oligonucleotides are also useful as diagnostic and research reagents. AAZ47769 represents the human CD40 nucleotide sequence. AAZ47770 to AAZ47772 represent human CD40 forward and reverse PCR primers, and a human CD40 PCR probe, respectively. AAZ47773 to AAZ47775 represent other PCR primers and a probe used in the exemplification of the present invention AAZ47685 to AAZ47768 represent phosphorothicate antisense

```
relating to the control of body weight of animals including humans. Worleic acids of at least 10 nucleotides which are hybridisable to a noncoding region of an OB nucleic acid have been created. The OB gene plays a critical role in the regulation of body weight and adiposity. The nucleic acids may be used as probes or as primers for PCR. They are useful for evaluating the presence of mutations in the human OB gene or for evaluating the level of expression of OB mRNA. Defects associated with OB gene expression result in obese phenotypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes antisense compounds of about 8-30 mucleotides in length targeted to the 5' UTR (untranslated region), 3' UTR or coding region of the nucleic acid encoding human Akt-2, which inhibits the expression of human AKT-2. Human Akt-2 as a member of the antiinflammatory, cytostatic and antiifectious activities, and can be used in gene therapy. They are useful in inhibiting the expression of human Akt-2 by contacting the cells or the tissues in vitro. They can also be used for adaptosis and treatment of infection, inflammation and tumour formation, and for prophylaxis. The present sequence represents a human Akt-2 phosphorothioate antisense oligonucleotide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; Akt-2; antisense oligonucleotide; phosphorothioate; inhibition; serine/threonine kinase; antiinflammatory; cytostatic; antiifectious; gene therapy; infection; inflammation; tumour; ss.

AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the development of pharmaceutical differential efficacious responses to and side effects from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and are not actually given a sequence in the Sequence Listing from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel biallelic markers used to construct a high density disequilibrium

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7401 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                         Human biallelic marker downstream amplification primer SEQ ID NO:7891.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from differential efficacious responses to and side effects from differential agents acting on a disease as well as other treatment.

Kappa-B proteins are involved in a diverse set of signaling pathways involving stress, apoptosis, cancer, growth, infection and inflammation. Antisense oligonucleotides are able to inhibit expression of the p65 subunit and may therefore be used in the treatment of disorders associated with NF-kappa-B p65 subunit expression. They may be used as a prophylaxis to prevent or delay infection, inflammation or tumour formation. Antisense compounds may also be used for research and diagnostics because they hybridise to nucleic acids encoding NF-kappa-B p65 subunit mRNA levels was measured using real-time quantitative PCR and Northern blot analysis. Antisense oligonucleotides were synthesised on an
The present sequence is one of a number of oligonucleotides designed to target different regions of the human NF-kappa-B p65 subunit, which is a member of the Rel/NF-kappa-B family of transcription factors. Rel/NF-

Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.

Claim 14; Page 260; 1592pp; English.

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense cligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodiator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with cativaring peptide factors and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokines and chemokine receptors, adenosine receptors, bradykinin receptors, central creceptors, adenosine receptors, bradykinin receptors, central creceptors, defensins, growth factors, bradykinin receptors, central creceptors, brinding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bunochoconstriction) and/or lung inflammation, allergy (es) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergy conditions impeded respiratory vasoconstriction, inflammation, allergy conditions, mand/or lung inflammation, allergy (es) and/or bronchoconstriction, and/or lung inflammation, allergy (es) and/or surcer assumply are appressed or condition, emphysema, chronic obstructive pulmonary disease (OPPD), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary transplantation rejection, pulmonary undertions, bronchitis, and/or cancer AAFIRJ44 to AAFIZ1643 represent human polynucleotide fragment invantions eligonucleotides used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   animal which comprises administering mammalian obesity (08) polypeptide. The products of the invention have anorectic activity. The OB polypeptide at a dose of 5 mg/g/day in 300 micro littres of PBS was injected intraperitoneally into mice. Control mice were injected with PBS dialysate of the recombinant protein. The body weight of the mice was noted. The results shows that recombinant the OB polypeptide is capable of reducing a body weight and is found to be effective when it is administered daily. The OB polypeptide acts as a part of the signalling pathway by which adipose tissue communicates with the brain and other organs. (I) is useful for modulating body weight of an animal especially humans. This sequence represents a PCR primer used in the amplification of a human OB protein described in the method of the invention
                                                                                                                                                                    This invention describes a novel method for modifying body weight of an

Two series of antisense oligonucleotides were synthesised. The first series comprised 9-30 oligodeoxynucleotides with a phosphorothicate backbone. The second series comprised chimeric oligonucleotides composed of a central gap region, consisting of ten 2'-deoxynucleotides, which was flanked on both sides by four-nucleotide wings. The wings were composed of 2'-methoxyethyl (2'-MOE) nucleotides. Both series contained the same mucleotide sequences. The antisense compounds are useful for research, diagnosis, treatment and prophylaxis to prevent or delay infection, inflammation or tumour formation. Therapeutically the oligonucleotides are highly safe and are effectively administered to humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense compounds targeted to steroid receptor RNA activator useful for diagnosis, prophylaxis and treatment of diseases associated with the steroid activator, such as infection, inflammation or tumor formation.
Human, SRA; steroid receptor RNA activator; cytostatic; antiinflammatory; SRA inhibitor; cancer; infection; antisense oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, mouse, anabolic, cytostatic, immunostimulant,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is a PCR primer which was used in an invention relating to the control of body weight of animals including humans. Antibodies against the mammalian obesity (0B) polypeptide have been identified. The antibodies are useful for modulating the activity of 0B to control body weight and fat content and/or to treat certain pathological conditions in which there is abnormal depression or levation of body weight. The antibodies are used to treat weight loss associated with cancer, AIDS and anorexia nervosa. They are useful for the diagnosis of nutritional disorders such as obesity and diseases associated with obesity, such as hypertension, heart disease and Type II diabetes. The kits are used to determine the presence or amount of 0B in the blood or plasma of an individual
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel antibody to mammalian obesity polypeptide useful for diagnosis and treatment of weight loss associated with disorders such as cancer, AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Prolactin regulatory element binding protein; PREB protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel antisense compounds useful for inhibiting the expression of human 3-phosphoinositide dependent protein kinase-1, useful e.g. for treating inflammation, tumors and infections.
                                                                                                                               The specification describes a prolactin regulatory element binding (PREB) protein. The protein is a kinase-mediated hormonal regulator of prolactin gene expression, i.e. a transcription factor. The protein binds to the lP element pf the prolactin promoter. PREB proteins are useful for treating osteoporosis. PREB modulators are useful for treating cancer, autoimmune diseases by inhibiting the expression of prolactin. PREB antisense sequences are also useful for treating a development defect. Inhibition of prolactin gene expression is useful for inhibiting graft-versus-host diseases in transphantations. PREB polymucleotides are useful as a probe for diagnosing trisomy 2p in a subject. PCR primers AAA75984-87 were used to amplify a human PREB gene fragment
                                             New polynucleotide encoding prolactin regulatory element binding protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is one of a large number of antisense oligonucleotides which are targeted to a nucleic acid molecule encoding human 3 sphosphoinositide dependent protein kinase-1 (PDK-1). The antisense compounds may be oligodeoxynucleotides or chimeric oligonucleotides containing a central gap region, consisting of ten 2'-
                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                 useful for treating osteoporosis, cancer and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                               .;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; PDK-1; 3-phosphoinositide dependent protein kinase-1; antisense oligonucleotide; phosphorothioate; antiinflammatory; cytostatic; antimicrobial; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides the protein and coding sequences of Arabidopsis thaliana WRN1. This protein is capable of altering the vernalisation responses of a plant. Also provided are a number of PCR primers used to isolate the sequences. The sequences are useful in the production of corp plants, where they are able to control the timing of flowering, the duration of vernalisation required, the optimum temperature, or even eliminate the need for vernalisation completely. The present sequence is a PCR primer used to isolate the VRN1 coding sequence
                                                                                                                                                                                                                                                                                                                                                                Novel VRN1 polynucleotide sequence encoding a polypeptide which alters vernalization response of plant in which VRN1 nucleic acid is expressed, useful for influencing and assessing vernalization phenotype of plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy

                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of Arabidopsis thaliana VRN1. This protein is capable of altering the vernalisation responses of a plant. Also provided are a number of PCR primers used to isolate the sequences. The sequences are useful in the production of crop plants, where they are able to control the timing of flowering, the duration of vernalisation required, the optimum temperature, or even eliminate the need for vernalisation completely. The present sequence is a PCR primer used to isolate the VRN1 coding sequence
                                                                                                                                                                                                                                                                             Novel VRN1 polynucleotide sequence encoding a polypeptide which alters vernalization response of plant in which VRN1 nucleic acid is expressed, useful for influencing and assessing vernalization phenotype of plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tumour suppressor gene 16; TSG16; immune response modulator; inflammatory response modulator; signal transduction activator; cytokine inhibitor; gene therapy; anticancer; anti-inflammatory; autoimmune disorder; infection; chromosome 16q24.3; human; cellular proliferation suppressor; PCR primer; ss.

The present invention relates to human tumour suppressor gene 16 (TSG16; see AAH2368B). TSG16 was isolated from chromosome 16q24 3. TSG16 suppresses cellular proliferation. TSG16 is useful for treating disorders associated with decreased expression or activity of TSG16, e.g. cancers, (auto)immune disorders, inflammation, complications of wound healing and infections (by viruses, bacteria, fungi, parasites, protozoa or helminths). The present sequence is a PCR primer, which was used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a composition for stimulating an immune response in a patient having an adenocarcinoma or colorectal cancer. The composition comprises an allogeneic tumour cell selected from SW620 cell, COLO 205 cell and SW403 cell, and a physiological carrier. The allogeneic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Colorectal cancer; immunostimulant; cytostatic; immune response; MAGE-4; adenocarcinoma; allogeneic tumour cell; SW620 cell; COLO 205 cell; ss; SW403 cell; colon; breast; lung; prostate; cancer; vaccine; PCR primer.

patient. The composition is useful for stimulating an immune response in adenocarcinoma, e.g. colon, breast, lung or prostate adenocarcinoma. The use of allogeneic tumour cells provides a generic source of antigen that can be administered to a variety of patients, in contrast to using autologous tumour cells, which must be isolated from each individual patient. The allogeneic cells are suitable as a cancer vaccine and can stimulate an immune response against autologous tumour cells of a cancer patient. The present sequence represents the reverse stimulates an immune response to an autologous tumour cell in the PCR primer used in gene expression analysis of tumour antigen MAGE-4

An antisense compound targeted to a nucleic acid molecule encoding a member of the human Rho family of small GTP binding proteins useful for treating e.g. cancer and ischemia.

Example 16; Page 73; 156pp; English.

This invention relates to an antisense compound targeted to a nucleic acid molecule encoding a member of the human Rho family of small GTP binding proteins, where the antisense compound inhibits the expression of the member of the human Rho family. The invention includes antisense oligonucleotides AAF94580 - AAF94637 Which target a RhoA nucleotide sequence, AAF94645 - AAF94684 which target a RhoB nucleotide sequence, AAF94645 - AAF94725 which target a RhoC nucleotide sequence, AAF94709 which target a Rac 1 nucleotide sequence, AAF94769 which target a Rac 1 nucleotide sequence and AAF94795 - AAF94809 which target a Rac 1 nucleotide sequence and AAF94795 - AAF94800 which target byperproliferative conditions, especially cancer, abnormal wound healing or clotting conditions and isofahemial-freperfusion or recoxygenation injury. The compound may also be used to diagnose the above conditions RESULT 84,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to glaucoma-coding DNA sequences (AAI66120 and AAI66121) for understanding better causes and mechanism of glaucoma and to develop more effective diagnosis kits. New sequences of glaucoma-coding DNA substitute thymine for cytosine at the site of 46th arginine of conventional glaucoma-coding DNA sequence to become a stop codon and thymine for cytosine at the site of 351th threonine of conventional glaucoma-coding DNA sequence to express isolaucine. The present sequence is that of a PCR primer, useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New glaucoma-coding DNA sequences for studying glaucoma and developing

The present invention describes an assemblage comprising two primers, each of which can be used to amplify the intergenic spacer region IGS1 from one of various strains of the yeast Cryptococcus neoformans. A number of primers and probes are provided, as are the sequences of the IGS1 for 91 C. neoformans strains. This is useful in the discrimination of pathogenic yeasts, and the sequences can be used to construct a database having the same purpose. The present sequence is a probe or

                                                                                                                                                                                              The present invention describes a homozygosity deletion domain co-
existing in the 36-position of the first chromosome short arm (1p36) in
human neuroblastoma. Also described are base sequences from the 1p36
position of human neuroblastoma cell lines (NB-1 and NASS-NB-SCH-1),
which are tumour suppressor genes in human neuroblastoma. The genes are
tumour suppressor genes, base sequence data of which are applicable as
tumour markers and reagents in studying mechanism of tumour body
formation, and gene diagnosis of tumours as well as in developing anti-
cancer drugs. AAF97787 to AAF97789 represent PCR primers used in the
exemplification of the present invention, and AAF97830 to AAF97814
                                                                                               Human 1p36 homozygosity deletion domain from the 36-position of first chromosome short arm in human neuroblastoma cell lines, applicable e.g. in gene diagnosis of tumors as well as in developing anti-cancer drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human 1p36 homozygosity deletion domain from the 36-position of first chromosome short arm in human neuroblastoma cell lines, applicable e.g. in gene diagnosis of tumors as well as in developing anti-cancer drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; chromosome 1; 1p36; neuroblastoma cell line; NB-1; anticancer; tumour suppressor; human 1p36 homozygosity deletion domain; tumour; diagnosis; PCR primer; ss.

The present invention describes a homozygosity deletion domain cohumsing in the 36-position of the first chromosome short arm (1p36) in human neuroblastoma. Also described are base sequences from the 1p36 position of human neuroblastoma cell lines (NB-1 and MASS-NB-SCH-1), which are tumour suppressor genes in human neuroblastoma. The genes are tumour suppressor genes in human neuroblastoma. The genes are tumour markers and reagents in studying mechanism of tumour body formation, and gene diagnosis of tumours as well as in developing anticancer drugs. AAF97787 to AAF97789 represent PCR primers used in the exemplification of the present invention, and AAF97830 to AAF978974

Arraying genome clones

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker multiwell plates; (b) a primer designed based on the chromosome marker sequence; is added to the markers is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell conference is changed so that the same discrimination Nos. succeed to plates; (e) the clones in the multiwell plates of the specified conference in the multiwell plates of the specified and lateral directions; (f) the mixed clones are cultured and the conference resultant cultures are amplified by using the above primer; (g) signals care detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABLA2957 to ABLA5322 represent

New obese polypeptide useful for inducing reduction of body weight in an animal, for preparing a composition for treating obesity, disease associated with obesity such as hypertension, heart disease or type II diabetes.

Example 10; Page 44; 144pp; English.

The invention relates to an obese (ob) polypeptide, also known as leptin, expressed predominantly by adipocytes and capable of inducing reduction of body weight in an animal. The polypeptide is useful for monitoring therapeutic treatment of a disease associated with elevated or decreased levels of ob polypeptide in a mammalian subject; for use in radioimmunoassays for measuring fat and/or plasma levels of ob protein or

correcting the presence and level of receptor for ob on tissues, such as hypothalamus; for screening expression libraries to isolate active creeptors; for use in cosmetics by improving body appearance by reducing fat deposits or appetite by improving body appearance by reducing fat deposits or appetite by improving body appearance by reducing conjugation with other cosmetic strategies e.g. surgery for its cosmetic effect; for identifying agonists or antagonists that affect its activity and has potential agricultural uses e.g. increasing the body weight of animals. Nucleic acid encoding the polypeptide is useful for identifying mutation in ob mucleotide, in gene therapy for obesity and in the consument of its encoded RNA and protein in nutritional disorders. A chost cell transfected with a vector expressing the polypeptide is useful for in the preparation of modulators of the polypeptide and its nucleic acid. In the preparation of modulators of the polypeptide and its nucleic acid. An immunogenic fragment of the polypeptide is useful for measuring the presence of the polypeptide in a sample; for evaluating the level of bolypeptide in a sacciated with elevated or decreased levels of bolypeptide in a comprising the polypeptide is useful for reducing body weight of an animal, in particular humans. A composition comprising an antagonist of the polypeptide is useful for increasing body weight of an animal, in particular humans. A composition comprising an antagonist of the polypeptide is useful for increasing body weight of an animal. Compositions containing the polypeptide and the antagonist are useful for containing the polypeptide and the antagonist of treating obesity, weight loss associated with cancer or AlbS, disease crassociated with obesity such as hypertension, heart disease or type II Sequence 18 BP; 3 A; 5 C; 3 G; 7 T; 0 U; 0 Other; specific PCR primer

Novel isolated ZTMPO-1 polypeptide, useful for modulating cell proliferation, and for treating disorders such as diabetes, muscular dystrophy and hypertension.

This invention relates to the cDNA and protein sequences of a novel isolated ZIMPO-1 polypeptide. ZIMPO-1 is a soluble protein with homology to the nuclear membrane proteins emerin and thymopoietins. The protein of the invention may have immunosuppressive, inotropic, cardiant, controlled to and hypotensive activities. The invention also comprises antibodies to ZMMPO-1 proteins which can be used to detect ZMMPO proteins and may be used to regulate the function of the protein. The sequences of the invention may be used for modulating cellular proliferation and differentiation, and for diagnostic purposes. The polypeptides can be used to treat immunological, reproductive, cardiac, haematopoietic disorders, leukemains, and hypertension. The present sequence represents a human ZMMPO-1 gene specific primer used in chromosomal mapping of the ZMMPO-1 gene specific primer used in Example 3; Col 57; 40pp; English.

The invention relates to a method for identifying drug candidate for promoting tissue-specific differentiation of stem cell. The method involves contacting culture of stem cells with library of test substances and analysing cells for increased tissue-specific gene expression. The method is useful for identifying drugs for regeneration of lost or damaged organs. The present sequence is mouse alpha-fetoprotein gene specific PCR primer, used to illustrate the method of the invention Identifying drug candidate for promoting tissue-specific differentiation of stem cell, comprises contacting culture of stem cells with library of test substances and analyzing cells for increased tissue-specific gene Example 2; Page 30; 36pp; English. expression

for sequence or ZTMPO-1 polynucleotide sequence or ZTMPO-1 polypeptide, diagnosing a neurological disease e.g., Alzheimer's disease. Use of probes or primers derived from human ZTMPO-1 polynucleotide

Example 1; Page 32; 32pp; English.

This sequence represents the human ZTMPO-1 specific PCR primer ZC15486 used to map the location of the ZTMPO-1 gene to chromosome 12q24.3 in the invention. The method of the invention comprises determining the presence of an alteration in the nucleic acid sequence of a polynucleotide encoding the ZTMPO-1 protein. Primers or probes derived from the human ZTMPO-1 polynucleotide sequence or protein sequence can be used for diagnosing neurological disease or a susceptibility to a neurological disease e.g. Alzheimer's disease. ZTMPO-1 probes and primers can also be used to detect and to localise ZTMPO-1 gene expression in tissue samples. ZTMPO-1 gene probes can also be used to detect aberrations and alterations e.g. aneuploidy, gene copy number changes, restriction site changes and rearrangements. The ZTMFO-1 genes and probes comprising ZTMFO-1 DNA can also be used to determine if the ZTMFO-1 gene is present on chromosome 12 or if there is a chromosomal structural abnormality associated with that region. The ZTMFO-1 polypeptides and polynucleotides may be used within diagnostic systems to detect ZTMFO-1 polypeptides or ZTMPO-1 polynucleotides in biological sample and which serves as a diagnostic tool for diseases that are associated with altered levels of ZTMPO-1 polynucleotides or polypeptides

                                                                                                                                                                                                                                                                                         Synthetic
                                                                                                                                                                                                                                                                    Ношо
The present invention relates to a novel method for identifying compounds capable of inhibiting KAR-associated protein (KARAP)-transduced immune signals. The method involves using functional and non-functional KARAP, cells co-expressing functional KARAP, functional receptors transducing their signal by zeta, gamma or epsilon and engineered cells and animals over-expressing functional KARAP, functional KARAP. The method is useful for identifying compounds capable of inhibiting KARAP. The method is useful for identifying compounds capable of inhibiting KARAP. The impairing the development and maturation of dendritic cells, by synthesis inhibition or through inhibition of the migration of dendritic cells, for maxing drugs intended for inhibiting dendritic cells, by synthesis inhibition or through inhibiting dendritic cells, by synthesis can analysis intended for inhibiting dendritic cells, by synthesis of immine response, where the activation of KAR has to be inhibited and contact sensitivity or multiple solerosis. The present DNA sequence is KARAP/DARIS specific reverse transcription
                                                                                                                                                                                                                                                                                    KAR-associated protein, KARAP-transduced immune signal, dendritic cell, antigen presentation; contact sensitivity, multiple sclerosis; neuroprotective; reverse transcription; RT-PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying KAR-associated protein-transduced immune signal inhibitor, comprises using cells co-expressing functional KARAP, and engineered cells and animals that over-express functional KARAP or bear non-

The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary cligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents of a samonella. Listeria monocytogenes and Hamophilus influenza, fungal infectious agents concerning temigautus, viruses e.g. T-cell lymphocytotrophis cirus, hepsergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, selected from Onchoverva volvulus, Entamoba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects. Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAI gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the electron and correlating (using a computer) identified production to a sets occurred and correlating (using a computer) identified to a sets occurred and correlating (using a computer) identified to a computer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ·

Modifying the body weight of an animal comprises administering an obese gene (OB) polypeptide analog. Example 10; Col 79-80; 152pp; English.

This invention describes a novel method of modifying the body weight of an animal comprising administering an obese gene (OB) polypeptide analogue, capable of modulating body weight and adiposity. The invention has anorectic and anabolic activity, AB161415-AB161468 represent PCR primers used in the detection of sequence tagged sites (STS's) and microsatellite markers used in the mapping of the human ob gene onto chromosome 7. These genetic markers represent an important tool for studying the possible role of the Ob gene in inherited forms of human

Katz E,

Novel homozygous stem cell useful for making desired progenitor cells, differentiated cells, group of differentiated cells, and tissue types.

Example 3b; Page 26; 49pp; English.

The invention describes an isolated homozygous stem cell (HS). HS is derived by producing a mitotically activated homozygous post-meiosis I derived by producing a mitotically activated homozygous post-meiosis I complete a blastocyst-like mass. HS is useful for making a desired mass of the blastocyst-like mass. HS is useful for making a desired composition of progenitor cell, differentiated cell, group of differentiated cells, or tissue type, by inducing HS to differentiate under suitable conditions. The differentiation is accomplished by the inclusion of a cell regulating factor, hormone or cytokine in the culture medium. The desired cells or group of cells is keratinising epithelial cells, epithelial absorptive cells of the gut, exocrine glands, urogenital tract, epithelial absorptive cells of the lining the lung, gut, exocrine glands, or urogenital tract or as a barrier, and epithelial cells lining closed internal body cavities, ciliated cells with propulsive function, contractile cells, cells of the blood and immune system, sensory transducers, autonomic neurons, supporting cells of sense organs and of peripheral neurons, and neurons or glial cells of sense organs and of peripheral neurons, cells, germ cells, and nurse cells, or one of the embryonic germ layers comprising the ectoderm, endoderm or mesoderm. Progenitor cells are useful in a therapy to treat a disease or condition selected from the parkinson's, Huntington's, Alzheimer's, amyotrophic lateral sclerosis cartinge defects or injuries, burns, foot ulcers, vascular disease, conjurance transcription or transcription or transcription or transcription. reverse transcriptase PCR primer used to analyse hepatic cell specific gene expression while studying the differentiation of HS cells into

(BENN/) BENNETT B. (MATT/) MATTHEWS W.

Bennett B, Matthews W;

Novel isolated cytokine receptor, termed WSX receptor, useful for treating diseases characterized by a decrease in hematopoietic cells e.g. anemia, or for treating myeloproliferative thrombocytotic diseases. WPI; 2003-416605/39

Example 8; Fig 7; 77pp; English.

The invention relates to an isolated cytokine receptor which plays a role in enhancing proliferation and/or differentiation of haematopoietic cells, termed Wax receptor comprising the amino acid sequence of mature human WSX receptor variant 13.2 or its extracellular domain. The WSX receptor is useful for identifying a molecule which binds to and/or activates the WSX receptor, as a diagnostic tool for measuring serum certivates the WSX igand, for treating diseases characterised by a decrease in hematopoietic cells (such as anaemia, thrombocytopaenia, hypoplasia, disseminated intravascular coagulation, myelodypalasia, immune (autoimmune) thrombocytopaenic purpura (ITP) and HIV induced ITP), immune (autoimmune) thrombocytopaenic purpura (ITP) and HIV induced ITP), complement, conditions and in iron deficiency, obselty or diabetes, for enhancing repopulation of mature blood cell lineages in cells having undergone chemo- or radiation therapy or bone marrow transplantation therapy, or for promotring kidney, liver and lung growth and/or repair. The WSX receptor is useful for producing anti-WSX receptor antibodies, for affinity purification of WSX ligand, for competitive screening of potential agonists or anagonists for binding to the WSX receptor and WSX leadlowment, e.g., in malignancies, or as standards or controls in assays for WSX receptor. A composition comprising the WSX polypeptide is useful development, e.g., in malignancies, or as standards or controls in assays for WSX receptor. A composition comprising the WSX polypeptide is useful development, e.g., in malignancies, or as standards or controls in assays for was an anaegonist for reducing activation of endogenous which expetor, and contract metabolic disorders (e.g. annorexia or steroid-induced controls in assays to treat metabolic disorders (e.g. annorexia or steroid-induced controls in assays receptor. Novel isolated cytokine receptor, termed WSX receptor, useful for treating diseases characterized by a decrease in hematopoietic cells e.g. anemia, or for treating myeloproliferative thrombocytotic diseases.

Example 8; Fig 7; 77pp; English.

The invention relates to an isolated cytokine receptor which plays a role in enhancing proliferation and/or differentiation of haematopoietic calls, termed Wax receptor comprising the amino acid sequence of mature human Wax receptor variant 13.2 or its extracellular domain. The Wax receptor is useful for identifying a molecule which binds to and/or activates the Wax receptor, as a diagnostic tool for measuring serum of levels of endogenous Wax ligand, for treating diseases characterised by a cerease in hematopoietic cells (such as anaemia, thrombocytopaenia, hypoplasia, disseminated intravascular coagulation, myelodysplasia, immune cautoimmune) thrombocytopic purpura (ITP) and HIV induced ITP), coapulation in iron deficiency, obseity or diabetes, for inflammatory conditions and in iron deficiency, obseity or diabetes, for enhancing repopulation of mature blood cell lineages in cells having undergone chemo- or radiation therapy or bone marrow transplantation

therapy, or for promoting kidney, liver and lung growth and/or repair. The MSX receptor is useful for producing anti-MSX receptor antibodies, for affinity purification of WSX ligand, for competitive screening of potential agoniets or antagonists for binding to the WSX receptor, as molecular weight markers, as reagents for mechanism studies of the WSX receptor or its ligands, to study the role of the WSX receptor and WSX ligand in normal growth and development, as well as abnormal growth and development, as well as abnormal growth and development, as standards or controls in assays for WSX receptor. A composition comprising the WSX polypeptide is useful as an antagonist for reducing activation of endogenous Wsx receptor, and to read metabolic disorders (e.g. anorexis or steroid-induced truncalobesity), stem cell tumours and other tumours which express WSX receptor. The present sequence represents a human WSX receptor probe used Sequence 18 BP; 4 A; 3 C; 4 G; 7 T; 0 U; 0 Other; in an antisense inhibition assay \$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

(EPIG-) EPIGENOMICS AG.

Taubert Mode1 Distler J,

WPI; 2003-256600/25.

The present invention describes a method for determining the methylation status of CpG dinucleotides within the genes for oestrogen receptor, p21, p27, p16, progesterone receptor, myoglobin, pcna, cdc2, c-ers2, p53 and/or CBA, which comprises contacting the target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides, and detormining from the methylation status of the CpG dinucleotides, the presence of a colon cancer. A set of oligomers or peptide nucleic acid (PNA)-oligomers can be used as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNP) useful in the genomic sequences, oligonucleotides and/or PNA-oligomers, useful in characterization, grading, staging and/or diagnosis of colon cancer. Determining methylation status of CpG dinucleotides using modified Claim 26; Page 140; 219pp; English.

of a corresponding genomic DNA by analysis of a chemically pretreated genomic DNA. The pretreated genomic DNA is useful for the determination of the methylation status of a corresponding genomic DNA and/or detection of SNPs. The methods and pretreated genomic DNA are also useful for the characterisation, classification, diagnosis and differentiation of colon cell proliferative disorders. Determining methylation status of CpG dinucleotides using modified genomic sequences, oligonucleotides and/or PNA-oligomers, useful in the characterization, grading, staging and/or diagnosis of colon cancer.

Claim 26; Page 140; 219pp; English.

The present invention describes a method for determining the methylation status of CpG dinucleotides within the genes for oestrogen receptor, p21, p27, p16, progesterone receptor, myoglobin, pona, cdc2, c-ersle. p53 and/or CEA, which comprises contacting the target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides, and determining from the methylation status of the CpG contacting the presence of a colon cancer. A set of oligomers or peptide nucleic acid (PNA)-oligomers can be used as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNP) cof a corresponding genomic DNA by analysis of a chemically pretreated genomic DNA is useful for the determination of the methylation status of a corresponding genomic DNA and/or detection of SNPs. The methods and pretreated genomic DNA are also useful for the characterisation, classification, diagnosis and differentiation of colon cell proliferative disorders. The invention relates to a method for producing homozygous stem cells, comprising isolating homozygous stem cells from the inner cell of a blastocyst-like mass into an animal host to create a stemplasm, which is cultured in vitro to derive homozygous stem cell lines. The method is useful for producing isolated homozygous stem cells, which are also useful for producing isolated homozygous stem cells, which are also useful for diagnosing or treating diseases, e.g. genetic diseases, neurodegenerative diseases (such as Alzheimer's disease or multiple sclerosis), endocrine-related disorders, cancers, diabetes, liver diseases, heart diseases, or immune defects. The concers, diabetes, liver diseases, heart diseases, or immune defects. The transplantation, gene therapy, cell replacement therapy or in treating transplantation, gene therapy, cell replacement, spinal cord injury or burns).

These cells are useful for generating cells, masses of cells, tissues or organs for transplantation. This sequence represents an RT-PCR primer used to amplify mouse alpha-fetoprotein (AFP) DNA, used in the scope of

The invention relates to a method of generating tailor-made pluripotent stem cells having a desired genome, in which the MHC (major histocompatibility) antigens are reduced or absent. This sequence represents a primer used in the method of the invention. The invention also includes methods for the preparation of the pluripotent stem cells, by producing modified stem cells in which the MHC antigens are reduced or absent, then fusing the cells with reprogrammed somatic cells having the desired genome, and removing the genomic material originating from the stem cells. The tailor-made pluripotent stem cells may be used in the production of cells, tissues and organs for transplantarion to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunosuppressive, ss, primer, pluripotent stem cell, transplantation, major histocompatibility antigen; immune rejection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disease conditions in the recipient, without inducing immune rejection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Tailor-made pluripotent stem cells for production of donor organs and tissues which do not induce immune rejection when transplanted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                              The invention describes an OB (obese) polypeptide (also referred as leptin) (1), capable of modulating body weight, comprising amino acids 1.67 of a human or mouse OB polypeptide sequence of 167 amino acids (S1), given in the specification, or amino acids 22 - 166 a human or mouse OB polypeptide sequence of 166 amino acids (S2), given in the specification. The OB polypeptide is useful for reducing body weight in conditions of obesity, and as a target for neutralising antibodies which results in weight gain (protein therapy), for treating weight loss associated with cancer, acquired immunodeficiency syndrome (AIDS) or anorexia nervosa. This sequence represents a primer associated with the isolation of the human obese (ob) or leptin gene
                                                                                            OB polypeptide; obese polypeptide; leptin; body weight; obesity; weight gain; protein therapy; weight loss; cancer; AIDS; human; acquired immunodeficiency syndrome; anorexia nervosa; PCR; primer; ss.

The invention relates to an isolated leptin/WSX receptor comprising a sequence of mature human WSX receptor variant 12.1. Also disclosed are the 13.2 and 6.4 WSX receptor variants (and DNA molecules encoding all 3 proteins), a partial mouse WSX receptor and its encoding DNA sequence. The WSX receptor is useful for preparing a composition for treating diseases mediated by WSX receptor, especially diseases characterised by a decrease in haematopoletic cells, e.g., ansemina; thrombocytopaenia, thrombocytopaenia, chypoplasia, disseminated intravascular coagulation (DIC), mypelodysplasia, humone (autoimmune) thrombocytopaenic purpura (ITP), and HIV induced ITP. The WSX receptor is also useful for treating metabolic disorders such as concexia, obesity (e.g. steroid-induced truncalobasity) tumours such as stem cell tumours, inflammatory conditions, iron deficiency, diabetes, can cell tumours, inflammatory conditions, iron deficiency, diabetes, cand failure, conditions related to haematopoietic cell proliferation (such as in bone marrow transplantation and for promoting kidney, lung and liver growth and/or repair. An experiment was performed to show antiense inhibition of human and mouse WSX receptors. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; ss; PCR; secreted protein; transmembrane protein; PRO; vulnerary; cardiant; antidiabetic; anorectic; antiarthritic; angiogenesis; cancer; atomatic capilitary; endothelial cell growth; wound healing; stimulated T-lymphocyte proliferation; immune response suppression; neonatal heart hypertrophy; cardiac insufficiency disorder; endothelial growth factor; inflammation; mononuclear cell; essinophil; diabetes; obesity; or hyper-insulinaemia; hypo-insulinaemia; chondrocyte redifferentiation; bone disorder; cartilage disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human secreted/transmembrane protein PRO1780 Tagman PCR primer #1.
                                                                                                                                                                                                                                        New WSX receptor, useful for preparing a composition for treating diseases mediated by WSX receptor e.g., diabetes or obesity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated leptin/WSX receptor comprising a sequence of mature human WSX receptor variant 12.1. Also disclosed are sequence of mature human WSX receptor variant 12.1. Also disclosed are the 13.2 and 6.4 WSX receptor variants (and DNA molecules encoding all 3 proteins), a partial mouse WSX receptor and its encoding DNA sequence. The WSX receptor is useful for preparing a composition for treating diseases mediated by WSX receptor, especially diseases characterised by a decrease in haematopoietic cells, e.g., namemia, thrombocytopaenia, thrombocytopaenia, thrombocytopaenia, thrombocytopaenia to mumune (autoimmune) thrombocytopaenic purpura (ITP), and HIV induced ITP. The WSX receptor is also useful for treating metabolic disorders such as anorexia, obesity (e.g. steroid-induced truncalobesity) tumours such as stem cell tumours, inflammatory conditions, iron deficiency, diabetes, tenal failure, conditions related to haematopoietic cell proliferation cy such as in bone marrow transplantation and for promoting kidney, lung and liver growth and/or repair. An experiment was performed to show antisense inhibition of human and mouse WSX receptors. The present

The polypeptide of the invention demonstrates cytostatic activity and may be used for determining the presence of, or predisposition to a disease associated with altered levels of expression of the polypeptide, including metabolic disorders, immune disorders, neurodegenerative disorders, circulatory diseases, haemopoletic disorders, wasting diseases and cancer. The polypeptide may also be utilised during gene therapy procedures, vaccine development and transgenic animal production. The current sequence is that of the PCR primer of the invention which was
                                                                                                                                                                                                                                                                                                    New isolated NOVX polypeptide, useful for determining the presence of, or predisposition to a disease associated with altered levels of expression of the polypeptide, and for treating or preventing cancer.
                                                                                                                                                                            Gorman L;

This invention relates to a novel method for detecting and differentiating between lung cell proliferative disorders associated with at least one gene and/or their regulatory regions. Specifically, it refers to a method comprising contacting a target nucleic acid in a biological sample with at least one reagent, wherein the reagent is able to distinguish between methylated and non-methylated CpG dinucleotides present in the target DNA. As such, it is possible to further
                                                                                                                                                     The invention relates to a novel isolated spore wall protein 1 and spore wall protein 2. A protein of the invention has protozoacide activity, and may be used as a vaccine. The spore wall proteins 1 and 2, nucleic acids encoding the proteins and the composition are useful for producing an immune response to microsporidia, or diagnosing, preventing and treating microsporidiosis in a subject. The present sequence represents a fragment of a spore wall protein gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR; primer; ss; lung cell proliferative disorder; CpG dinucleotide; adenocarcinoma; squamous cell carcinoma; cytostatic; probe; PNA-oligomer; cytosine methylation state.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting and differentiating cytosine methylation state of genomic DNA, useful for diagnosing, treating prognosticating and/or monitoring lung cell proliferative disorders e.g. adenocarcinoma and squamous cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer oligo used for analysing CpG islands in genomic DNA (SeqID 852).
                                             New spore wall protein 1 and spore wall protein 2 of Encephalitozoon intestinalis, useful for producing an immune response to microsporidia, or diagnosing, preventing and treating microsporidiosis in a subject.
                                                                                                                                                                                                                                                                                                                                                                           Gaps

          and squamous cell carcinoma, and their respective adjacent lung tissue. The present invention describes cytostatic oligomers and PNA-oligomers that are useful as probes for determining the cytosine methylation state or single nucleotide polymorphisms (SNPs) of the target sequence. This oligomucleotide sequence is a primer oligomer used for the analysis of CPG positions within genomic DNA, used in an exemplification of the
                                                                                                                                                                                                                                                                                                                                                        Primer oligo used for analysing CpG islands in genomic DNA (SeqID 853).

Detecting and differentiating cytosine methylation state of genomic DNA, useful for diagnosing, treating prognosticating and/or monitoring lung cell proliferative disorders e.g. adenocarcinoma and squamous cell carcinoma.

Claim 15; SEQ ID NO 853; 58pp; English.

This invention relates to a novel method for detecting and differentiating between lung cell proliferative disorders associated with at least one gene and/or their regulatory regions. Specifically, it refers to a method comprising contacting a target nucleic acid in a biological sample with at least one reagent, wherein the reagent is able to distinguish between methylated and non-methylated CpG dinucleotides present in the target DNA. As such, it is possible to further differentiate and diagnose medical conditions including adenocarcinoma and squamous cell carcinoma, and their respective adjacent lung tissue. The present invention describes cytostatic oligomers and PNA-oligomers that are useful as probes for determining the cytosine methylation state or single nucleotide polymorphisms (SNPs) of the target sequence. This oligomucleotide sequence is a primer oligomer used for the analysis of CpG positions within genomic DNA, used in an exemplification of the invention

```
The invention relates to agonist antibodies which specifically bind to the human MSX receptor. The agonist antibodies are useful for activating the MSX receptor and for enhancing proliferation or differentiation of a cell comprising the WSX receptor, by exposing the cell to an antibody. The antibodies are also useful for reducing weight, specifically in the antibodies are also useful for reducing weight, specifically in the treatment of obesity, bulimia and other disorders associated with abnormal expression or functions of WSX receptor genes, for treating metabolic disorders such as diabetes, for reducing excessive levels of insulin in human patients and for treating patients suffering from food consumption and related pathological conditions such as type II adult onset diabetes, infertility, hypercholesterolaemia, hyperlipidaemia, cardiovascular diseases, arteriosclerosis, polycystic ovarian disease, osteoarthitis, dermatological disorders, insulin resistance, hypertriglyceridaemia, cancer, cholelithiasis and hypertension. The agonist antibodies are useful for activating the WSX receptor and for enhancing proliferation or differentiation of a cell comprising the WSX receptor, by exposing the cell to an antibody. The antibodies are also useful for reducing weight, specifically in the treatment of obesity, bulimia and other disorders associated with abnormal expression or functions of WSX receptor genes, for treating metabolic disorders such as diabetes, for reducing excessive levels of
antibodies are also useful for treating kidney ailments, lung dysfunctions such as emphysema, haemorrhages, diseases characterised by decrease in blood cells such as anaemia, thrombocytopenia, hypoplasia, metabolic disorders such as cachexia, anorexia and loss of appetite, other tumour related disorders. This sequence represents a human WSX receptor DNA antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; WSX receptor; ss; weight reduction; obesity; bulimia; metabolic disorder; diabetes; insulin level reduction; food consumption; type II adult onset diabetes; infertility; hypercholesterolaemia;
                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel agonist antibody useful for activating WSX receptor and for enhancing proliferation or differentiation of a cell comprising WSX receptor, which specifically binds to the WSX receptor.

ö
insulin in human patients and for treating patients suffering from food consumption and related pathological conditions such as type II adult canset diabetes, infertility, hypercholesterolaemia, hyperlipidaemia, cardiovascular diseases, atterfosclerosis, polycystic ovarian disease, osteoarthritis, dermatological disorders, insulin resistance, hypertriglyceridaemia, cancer, cholelithiasis and hypertension. The antibodies are also useful for treating kidney allments, lung dysfunctions such as emphysema, haemorrhages, diseases characterised by metabolic disorders such as cancharia, anomania, hypoplasia, metabolic disorders such as cachexia, anorexia and loss of appetite, and other tumour related disorders. This sequence represents a human WSX

agents. The polynucleotides are useful as hybridisation probes for a cDNA The invention relates to human PRO polypeptides and the polynucleotides encoding them. The sequences are useful in the preparation of a medicament for treating a condition responsive to a PRO polypeptide. The polypeptides are useful in a number of functional biological assays, as molecular weight markers for protein electrophoresis and as therapeutic

New nucleic acid encoding a new human endothelial polypeptide designated EG-1, useful for diagnosing and treating angiogenesis-associated disease such as heart disease, stroke and cancer.

Claim 1; SEQ ID NO 9; 54pp; English.

The invention relates to an isolated nucleic acid comprising a nucleic acid sequence that specifically hybridises to a human endothelial-derived acid sequence that specifically hybridises to a human endothelial-derived gene-I (EG-I) cDNA or encodes a human EG-1 polypeptide. Also included are a polypeptide encoded by EG-1 whose expression is upregulated in an endothelial cell, a cell transfected with an EG-1 nucleic acid, an antibody that binds to EG-1 protein, screening for an agent that comprising a recombinantly modified EG-1 gene so that the gene does not transcribe a functional EG-1 protein, identifying a predisposition to comprising a recombinantly modified EG-1 gene so that the gene does not transcribe a functional EG-1 protein, identifying a predisposition to a comprising suppress of a disease characterised by abnormal anglogenesis and inhibiting anglogenesis comprising inhibiting expression or activity or an EG-1 gene product. The invention is used to diagnose and treat anglogenesis related disease such as heart disease, stroke and cancer. The effects of EG-1 inhibition using anti-EG-1 antibodies or EG-1 caused inhibition using anti-EG-1 antibodies against all these sequences were used. Interference with antibodies or Eg-1 action in endothelial migration and tube formation, assayed using standard techniques. The present sequence is a PGR primer

New nucleic acid encoding a new human endothelial polypeptide designated EG-1, useful for diagnosing and treating angiogenesis-associated disease such as heart disease, stroke and cancer.

Claim 1; SEQ ID NO 7; 54pp; English.

The invention relates to an isolated nucleic acid comprising a nucleic acid sequence that specifically hybridises to a human endothelial-derived acid sequence that specifically hybridises to a human endothelial-derived appeared [EG-1] to TORA or encodes a human EG-1 polypeptide. Also included are a quothelial cell, a cell transfected with an EG-1 nucleic acid, an antibody that binds to EG-1 protein, screening for an agent that comprising a recombinantly modified EG-1 gene so that the gene does not comprising a recombinantly modified EG-1 gene so that the gene does not comprising a recombinantly modified EG-1 gene so that the gene does not cranscribe a functional EG-1 protein, identifying a predisposition to developing symptoms of a disease characterised by abnormal anglogenesis and inhibiting anglogenesis comprising inhibiting expression or activity or an EG-1 gene product. The invention is used to diagnose and treat anglogenesis related disease such as heart disease, stroke and cancer. The effects of EG-1 inhibition using anti-EG-1 antibodies or EG-1 The effects of EG-1 inhibition using anti-EG-1 antibodies or EG-1 peptides (ADC73363 - ADC73367) was examined. Antibodies or EG-1 Sequences were used. Interference with antibodies or peptide fragments sequences were used interference with antibodies or peptide fragments caused inhibition in endothelial call proliferation, increase in apoptosis, and inhibition of the present sequence is a PCR primer assayed using standard techniques. The present sequence is a PCR primer assayed using standard tecused to amplify EG-1 cDNA.

C transmentance process trems 123 fully defined sequences as given in the specification (including their extracellular domains either cor without their associated signal peptides. Also include are the nucleotide (NA) sequence encoding PRO, a vector comprising the PRO NA, a host cell comprising the vector, producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anticrompising PRO fused to a heterologous amino acid sequence, and an anticrompising PRO fused to a heterologous amino acid sequence, and an anticrompising PRO fused to a heterologous amino acid sequence, and an anticrompising PRO fused to a heterologous amino acid sequence, and an anticromedia. PRO and PRO NA are useful as hybridisation. PRO is also useful for issue typing. PRO and PRO NA are useful as hybridisation or probes for a cDNA library to isolate the full-length PRO cDNA. PRO NA is useful in development and screening useful readents processing useful sor knock-out animals which are useful in development and screening useful readents. PRO NA is also useful in development and screening useful reading immune response. PRO 1246 and PRO 1246, propypeptides are useful for treating cancerous tumours. PRO 1250, PRO 1246 and PRO 1246 polypeptides are useful for treating cancina clistificiency disorders of polypeptides are useful for treating benome and/or cartilage disorders of polypeptides are useful for treating diabetes in skeletal muscle cells and obesity. PRO 1265, PRO 1244 and PRO 1362, PRO 1255 and PRO 1418, and obesity. PRO 1265, PRO 1244 and PRO 1362, PRO 1364 properties are useful for treating diabetes in skeletal muscle cless and obesity. PRO 1265, PRO 1244 and PRO 1369, PRO 1304, PRO 1304, PRO 1404, P
transmembrane protein) having at least 80% amino acid sequence identity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequence is a Tagman PCR primer used to assay PRO gene amplification in certain tumour cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Seguence 18 BP; 3 A; 6 C; 5 G; 4 T; 0 U; 0 Other;

This invention describes novel oligonucleotides used in a method for detecting beer-spoilage bacteria in a sample. The bacteria detected include lattic acid bacteria of the genera Lactobacillus or Pediococcus, especially the species L. coryniformis, L. perolens, L. buchneri, L. plantarum, L. fructivorans, L. lindheri, L. casei, L. brevis or P. damnosus or Gram-negative bacteria of the genera Pectinatus and Megasphaera, specifically P. frisingensis, P. cerevisiphilus and Cerevisiae. The oligonucleotides of the invention provide rapid detection of spoilage bacteria (typically within 48 hours, compared with 7-12 days for conventional culture methods), can detect all relevant bacteria in parallel, can differentiate between species of the same genus, and are easy to use. ADE14806-ADE15247 represent the oligonucleotides used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligonucleotides, useful for rapid detection of beer-spoilage bacteria by in situ hybridization, are specific for type, genus or

                                                                                                                                                                                                                                               The invention relates to an assay for identifying a compound that modulates the activity of a gene or protein associated with rheumatoid arthritis. The method of the invention comprises providing a cell expressing a gene or protein associated with rheumatoid arthritis, contacting the cell with a test compound, and determining whether the test compound modulates the activity of the gene or protein. The method of the invention is useful for preparing a composition for treating rheumatoid arthritis. The current sequence represents a PCR primer used in the isolation of rheumatoid arthritis associated genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   29-SEP-1
The invention relates to a method of detecting and differentiating between lymphoid cell proliferative disorders associated with at least cone gene and/or their regulatory regions in a subject by contacting a target nucleic acid in a biological sample obtained from the subject with at least one reagent or series of reagents that distinguish between card. The genes and/or their regulatory regions are preferably selected from MDRI, CSNKZB, EGR4, AR, CDK4, RBZ, CDC25A, GPID beta, MYDDI, CDB3, MYCLI, ELKI, ABLI, ABC, BCL2, CDH1, CDKNLB, CDKNLB, CDKNLB, CDKNLS, CSSTPD, HIC-1, MGWT, MLH1, MOS, MYC, PTEN, RBL2, TGFBR2, TDY3, CDKNLC, GSTSDeta, ESR1, APAFF, BAKL, BAX, MXC, Oligomers, peptide nucleic acid (PNA)-oligomers and/or isolated nucleic acids based on the sequences of the agenes are useful for detecting the methylation state of all the CC GG dinucleotides within one or more the sequences, or their complements, for determining the cytosine methylation state and or single nucleotide conditions such as diffuse large B-cell lymphoma, mantle cell lymphoma, chronic lymphoma, They are also useful for detecting to a least two of the medical conditions such as diffuse large B-cell lymphoma, mantle cell lymphoma, chronic lymphoma, sequence conditions used as used as useful for detecting of a predisposition to, differentiation between subclasses, diagnosis, prognosis, treating and/or phone mantly conditions within the phone mantly condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; PCR; primer, secreted protein; transmembrane protein; PRO; tumour; immune response; cardiac insufficiency disorder; calcium flux; umbilical vein endothelial cell; bone disorder; cartilage disorder; arthritis; wound healing; diabetes; skeletal muscle cells; obesity; Berger disease; nephropathy; Schonlein-Henoch purpura; coeliac disease; dermatitis; herpetiformis; Crohn's disease; thalassaemia; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                        or
                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity
                                                                                                                                                                                                                 Novel secreted and transmembrane PRO polypeptides useful for treating cancers, kidney disorders, Crohn's disease, diabetes mellitus, hyperhypo-insulinemia, sports injuries and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                      ;

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABH99989 and ABI0010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABE9989, and nthe invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99999, ABF00010-ABH99999 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

The invention relates to haplotyping the FK506-binding protein 8 (38kD) (FKBPB) gene in an individual. The method involves determining the identity of the nucleotide pair at one or more polymorphic sites selected from P1 to P26 (described in the specification). The invention is useful to improve the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with FKBPB activity, for example immunosuppression and cancer. Sequences AAI67300-351 represent allele-specific oligonucleotide (ASO) primers for detecting FKBPB gene polymorphisms. Note: some of these sequences (alternate sequence Id numbering-31, 33, 35. .81) differ from those with the same seq Id No.s indicated in the disclosure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; primer; ss; cytochrome P450; subfamily XXVIIB; 25-hydroxyvitamin D-1-alpha-hydroxylase; CYP27B1; isogene; hydroxylation; 25-hydroxyvitamin D-1-alpha-hydroxylase; CYP27B1; isogene; hydroxylation; 25-hydroxyvitamin D3; Z5(DH)D3; calcitriol; lalpha,25(DH)2D3; kidney; nuclear receptor; vitamin D; VDR; calcium homeostasis; cellular differentiation; SNP; single nucleotide polymorphism; pseudovitamin D-dependent rickets type I; haplotyping; genotyping; antibody; antisense; cancer; diabetes; inflammatory disorder; chromosome 12q13.3-q4; antiinflammatory; ASO; allele specific oligonucleotide.
                                                                                                                                  New haplotypes of the FK506-binding protein 8 gene, useful for genotyping that gene in individual and to design new therapy for associated disease such as immunosuppression and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

New genetic variants of the human polypeptide 1 (CYP27B1) gene, useful for treating disorders associated with aberrant expression or overproduction of TNF e.g. cancer, diabetes or inflammatory disorders. Claim 14; Page 14; 64pp; English

The invention discloses an isolated polymorphic polynucleotide comprising a coding sequence for a cytochrome P450, subfamily XXVIIB (25-0) a coding sequence for a cytochrome P450, subfamily XXVIIB (25-0) a coding sequence for a cytochrome P450, subfamily XXVIIB (25-0) a catalyses the hydroxylation of 25-hydroxyvitamin D3 [25(BH)D3] to catalyses the hydroxylation of 25-hydroxyvitamin D3 [25(BH)D3] to calcitriol (lalpha,25(GH)2D3) in the proximal tubule of the kidney. The binding of calcitriol to the nuclear receptor for the hormonally active form of vitamin D (VDR) activates the receptor with subsequent regulation of physiological events such as calcium homeostasis and cellular differentiation. The various polymorphisms in the CYP27B1 gene may cause pseudovitamin D-dependent rickets type I. The polymorlocide is useful for haplotyping, genotyphng, predicting a haplotype pair, identifying an association between a trait and at least one haplotype pair, identifying an association between a trait and at least one haplotype or haplotype pair association between a trait and at least one haplotype or haplotype pair. The CYP27B1 gene. The polymorphism in the CYP27B1 groundleotide is useful for raising a polymorphism in the CYP27B1 groundleotide encoding the isolated polymorleotide. The pharmaceutical composition, comprising the isolated polymorleotide or another composition. Comprising the isolated polymorleotide or another composition. Comprising the isolated polymorleotide or another compound that inhibits expression of the CYP27B1 isogene, is useful for treating disorders affected by expression or function of the CYP27B1 isogene e.g. cancer, diabetes or inflammatory disocrders. The sequences presented in CAB64884 ABS648897 are the allele specific oligonucleotide (ASO) primers which were used for detecting CYP27B1 gene polymorphisms. The CYP27B1

New isolated polynucleotide, polymorphic variant of somatostatin receptor 4 gene, useful for expressing somatostatin receptor 4 protein isoform used in drug screening techniques.

Claim 14; Page 14; 83pp; English.

The invention is an isolated polynucleotide having a somatostatin creeptor 4 (SSTR4) isogene that is one of 13 somatostatin genes as given in the specification, where each somatostatin gene has specific regions of a fully defined sequence of 9190 nucleotides as given in the specification, and is defined by polymorphisms at positions 3922, 4723, 4784, 4835, 4814, 4921, 4948, 4986, 5216, 5329 or 5411. The solated polypeptide with a candidate agent and assaying for binding activity. The isolated polymorloscide is useful for studying contacting the polymorphism and haplotype data is useful for use in screening for candidate drugs to treat diseases related to SSTR4 protein for use in screening for candidate and haplotype data is useful for validating whether SSTR4 is a suitable target for drugs of cancer and disorders related to defects in hormone secretion, screening for such drugs and realso useful in gene therapy. The isolated polymorpide is useful in subsoluted the effect of variation on the biological activity of SSTR4 as well as on the binding affinity of candidate drugs targeting SSTR4 for treatment of cancer and disorders related to defects in hormone secretion. The isolated polymorphide is useful in a variety of drug screening assays to identify agents that bind specifically to all known screening assays to identify agents that bind specifically to all known structure and disorders related to defects in hormone candidate drugs targeting the SSTR4 protein. Predicting a maplotype pair contracts. between susceptibility to a disease, staging of a disease, or response to a drug. This polynucleotide sequence represents a preferred primer for detecting SSTR4 gene polymorphisms relating to the invention

```

method for haplotyptamine (serotomin) receptor 50 (HTRSA). A method for haplotyping the HTRSA gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the one more polymorphic sites and determining whether one of the copies of the gene is defined by one of the HTRSA haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype pair in a population exhibiting the trait with the frequency of the HTRSA gene can be identified by comparing the frequency of the haplotype pair in a population exhibiting the trait with the frequency of the haplotype pair in a population exhibiting the trait with the frequency of the haplotype or haplotype pair in a population indicates the trait is associated with the haplotype or haplotype pair. HTRSA and its corresponding DNA are used for studying the expression and contact of HTRSA activity, such as neurological disorders, including depression and epilepsy. Sequences ABR72239-ABR7238 represent allele-Primer, PCR, amplification, exon 2; human, BRCA1; BRCA2; allele, probe, hybridisation; detection; mutation; breast; ovarian; cancer; ss. invention relates to single nucleotide polymorphisms in the gene Novel genetic variants of 5-Hydroxytryptamine (Serotonin) Receptor isogenes, useful for improving efficiency and reliability in drug development for treating neurological diseases. 4.0%; Score 11.6; DB 1; Length 15; 91.7%; Pred. The invention specifically relates to the identification of 27 novel polymorphic sites within the ETFB gene.

Electron-transfer flavoprotein (ETF) is an obligatory electron acceptor for nine primary flavoprotein dehydrogenases and is located in the mitochondrial matrix. ETF is composed of an alpha (ETFA) and a beta mitochondrial matrix. ETF is composed of an alpha (ETFA) and a beta mitochondrial respiratory chain by ETF are transferred to the mitochondrial respiratory chain by ETF are transferred to the mitochondrial respiratory chain by ETF dehydrogenases (ETFBA).

Therefore ETFB is a pharmaceutically-important gene in the treatment of Therefore ETFB is polymorphisms identified in the invention are useful for genotyping and haplotyping the ETFB gene of an individual. The ETFB protein and nucleic acids of the invention are useful for studying the expression and function of ETFB in vivo. The ETFB protein and nucleic acids are also useful for testing the efficacy of therapeutic agents and compounds for glutaric acidaemia type II. The nucleic acids of the invention are useful in the production of a transgenic animal expressing the ETFB gene. Nucleic acids ABL39441-ABL39444 represent claimed ETFB allele-specific probes. The sequence represents PCR primer IFN-gamma sense, used to follow the progress and/or treatment of multiple sclerosis (MS). This is done by determining the amount of following cytokines, interlewin (IL)-18, IL-12P40, interferon (IFN)-gamma, IL-4, IL-10, transforming growth factor (TGR)-beta, IL-12Rbetal, IL-12Rbetal and/or IL-12p35 of the first biological sample obtained from person suffering from or suspected to suffer from MS, and optionally comparing it with a reference value. This method is useful for determining the success rate of treatment of MS by discriminating between patients with MS (regardless of the clinical subtrypes) and healthy controls, on the basis obtained from person suffering from or suspected to suffer from MS. The method enables a clinical subfrant to be able to determine or further substantiate the clinical subtype of patient quickly and accurately, and immediately upon the first The invention relates to the use of allele-specific oligonucleotides AAX34376-X34391 as probes for the detection of mutant BRCA1 and BRCA2 genes. The probes are immobilised on a membrane and labelled target nucleotide sequences, which hybridise to the probes, are detected after single hybridization step. The method and allele-specific oligonucleotides are used to detect gene mutations that predispose individuals to breast and ovarian cancer Monitoring progress and/or treatment of multiple sclerosis by comparing levels of interleukin (IL)-18, IL-12p40, interferon-gamma, IL-4, IL-10, transforming growth factor-beta, IL-12Rbetal, 2 and/or IL-12p35. primer; multiple sclerosis; MS; therapeutic; cytokine; interleukin; (IL)-18; IL-12p40; interferon-gamma; IFN-gamma; IL-4; IL-10; IL-12p35; transforming growth factor beta; TGF-beta; IL-12Rbeta1; IL-12Rbeta2; PCR primer IFN-gamma sense used to follow progress/treatment of MS. The invention comprises antisense oligonucleotides targeted to the human damage specific DNA binding protein 2 (DDB2 - also known as p48) gene, located on chromosome 11. DDB2 is a subunit of the the DDB protein which is believed to be a negative regulator of the E2F transcription factor. The antisense oligonucleotides of the invention are used to treat a sperson suspected of having or being prone to a disease or condition associated with DDB2/P48 expression. The present DNA sequence represents a human DDB2/P48 antisense oligonucleotide of the invention. NOTE: The present DNA sequence is a 2'-O-methoxyethyl gapmer and contains a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises antisense oligonucleotides targeted to the human damage specific DNA binding protein 2 (DDB2 - also known as p48) gene, located on chromosome 11. DDB2 is a subunit of the the DDB protein which is believed to be a negative regulator of the E2F transcription factor. The antisense oligonucleotides of the invention are used to treat a person suspected of having or being prone to a disease or condition associated with DDB2/p48 expression. The present DNA sequence represents a human DDB2/p48 antisense oligonucleotide of the invention. NOTE: The phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                 Antisense oligonucleotide which specifically hybridizes with a region of a nucleic acid encoding human Damage-specific DNA binding protein p48, useful for treating diseases and conditions associated with p48
                                                                                                          damage specific DNA binding protein 2; DDB2; p48; chromosome 11; DDB; B2F transcription factor; p48 expression-related disease; pbBb2 expression-related disease; phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

This sequence is a primer for DNA encoding a light chain complementarity determining region (CDR) from a tumour antigen specific antibody. The invention relates to a method for identifying a binding molecule having selective affinity for a ligand comprising: (a) selectively immobilising a diverse population of binding molecules to a solid support; (b) simultaneously contacting the diverse population immobilised on the solid support with 2 or more ligands; and (c) determining at least one binding molecule which selectively binds to one or more of the ligands. The method allows for the rapid and efficient methods for the identification of binding molecules which exhibit selective affinity for one or more pligands of interest. They are used particularly for identifying tumourspecific binding polypeptides which can be used as targeting agents for cancer therapy that minimises impact on non-tumour tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying binding molecules for ligands, particularly tumour antigens -by selectively immobilising a population of binding molecules to a solid support and screening for binding to two or more ligands.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Binding molecule; selective affinity; ligand; antibody library; anti-immunoglobulin reagent; phage expressed antibody library; tumour antigen; complementarity determining region; CDR; human disease; cellular pathology; human; Fab; light chain; sequencing; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequencing primer #2 for human Fab light chain (CDR region) DNA clone

The present invention relates to a method for identifying a binding molecule having selective affinity for a ligand. The method involves providing a solid support coated with an anti-immunoglobulin reagent, and a phage expressed antibody library, and contacting the solid support to the phage expressed antibody library. The invention also discloses a method for identifying an antibody having selective affinity for a tumour, and a complementarity determining region (CDR) of an antibody selective for a tumour antigen. The methods of the invention are useful for identifying a binding molecule having selective affinity for a ligand, for the discovery of specific reagents for diagnosis and treatment of human diseases, for identifying binding molecules to, for example tumour cells or other cellular pathologies for the selective targeting of therapeutic agents, or for the identification of binding molecules to normal or diseased tissues for the selective targeting of cor example diagnostic agents such as imaging reagents. The methods are methods allow the simultaneous screening of multiple binding molecules adminity for one or more ligands of interest. The methods allow the simultaneous screening of multiple binding molecules allow the simultaneous screening of multiple binding molecules can be simulative or function of either the binding molecules can be simulative with such solutions of binding molecules can be simulated screening against diverse populations of binding molecules can be simulated the second of the canding molecules of the canding screening against diverse populations of binding molecules can be simulated the second of the canding molecules can be simulated the second of the canding molecules can be simulated to the ligand of the canding second canding the distriction of either the binding molecules can be simulated to the canding the ca
                                                                                                                                                                                                                                                      Identifying binding molecules having selective affinity for ligands for discovering reagents for treating diseases, by contacting solid support coated with anti-immunoglobulin reagent to a phage expressed antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ligands to rapidly identify numerous molecules exhibiting a desired binding specificity. The methods provide improved sensitivity and specificity of detection through the selective immobilisation of the binding molecule population on a solid support. The present sequence represents a sequencing primer used in the examples of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 21 BP; 3 A; 7 C; 5 G; 6 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 11.6; DB 1;

```
New oligonucleotide analogues are provided which have an amide backbone. They are useful as therapeutic antisense molecules which bind to mRNA and thereby inhibit production of the protein encoded by the mRNA. They are stable, water-soluble and nuclease-resistant. The present sequence represents a specific example of the analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                        This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99899, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fire wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomers are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABF00010-ABE99989, ABF00010-AB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel oligonucleotide primers or peptide nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel oligonuclectide primers or peptide nucleic acid (RNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99899, ABF00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABE99899 and metabolic disorders. The represent the oligomers described in the invention. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH9989 and ABI00010-ABI82073 tepseent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                    Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Oligonucleotide SEQ ID NO 63570 for detecting SNP TSC0016788.

ABH45911 standard; DNA; 13 ABH45911; RESULT 922 ABH4591 8\$6666666668 ò 엄 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, coincamers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine Claim 1; SEQ ID NO 63570; 29pp + Sequence Listing; German. set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.

Claim 1; SEQ ID NO 245888; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
